Introduction to Spatial Data Lab

- Building a Cyberinfrastructure for Spatial and Global Studies

Dr. Wendy Guan, Harvard University

Dr. Shuming Bao, Future Data Lab

Topics

- Background of the Spatial Data Lab project**
- Challenges and Motivations**
- About Spatial Data Lab**
- Sponsored Research Activities**
- User Guide and Application**

Background of the Spatial Data Lab Project

- It is a project in the NSF **IUCRC** Spatiotemporal Innovation Center (**STC**)
- It is sponsored by **China Data Institute** and **Future Data Lab**, two Michigan-based non-profit organizations
- It is conducted at the Center for Geographic Analysis (**CGA**) at Harvard University
- It is a **collaboration** with many contributing organizations and scholars **world-wide**.

IUCRC: Industry–University Cooperative Research Centers

- IUCRC is a program under the National Science Foundation (NSF)
- It enables industrially-relevant, pre-competitive research via a multi-member, sustained partnerships among industry, academe, and government.
- The program was initiated in 1973.
- There are 75 active centers in 2021 (<http://www.iucrc.org/centers>), several dozen in the planning stage, and 100+ graduated in the past decades.

Why IUCRC

- Contributing to **the nation's research enterprise** by developing long-term partnerships among industry, academe, and government;
- **Leveraging NSF funds with industry** to support graduate students performing industrially relevant pre-competitive research;
- Expanding the innovation capacity of our nation's competitive workforce through **partnerships between industries and universities**; and
- Encouraging the nation's research enterprise to remain **competitive through active engagement** with academic and industrial leaders throughout the world.

Spatiotemporal Innovation Center

- This center's full name is I/UCRC for Spatiotemporal Thinking, Computing, and Applications (STC)
- It is one of the IUCRCs, formed in 2013.
- STC's research focus is on spatiotemporal principles, methodologies and applications.
- The STC completed its first phase (2013-2018), currently is in the second phase (2019-2024).

STC's Vision

Build a national and international spatiotemporal infrastructure to advance --

- **human intelligence** through spatiotemporal thinking;
- **computer software and tools** through spatiotemporal computing;
- **human capability** of responding to deep scientific questions and grand engineering challenges through spatiotemporal applications and education.

Sites and Principle Investigators

- George Mason University (phase I and II)
 - Chaowei (Phil) Yang, Professor of the Department of Geography and Geoinformation Science
- Harvard University (phase I and II)
 - S. V. Subramanian, Professor of Population Health and Geography, Faculty Chair of the Center for Geographic Analysis
- University of California at Santa Barbara (phase I)
 - Keith Clarke, Professor of the Department of Geography

Current and Past Members

- CDI (2019-present)
- DOS (2016-present)
- East View Geospatial (2013-2014)
- FDL (2020-present)
- NGA (2015-2016)
- OmniSci (MapD) (2016-present)
- RMDS (2019-present)
- SASMG (2016-2017)
- STIS (2015-2016)
- USGS CEGIS (2014-2016)
- ZJSG (2017-2019)
- FGDC (2013-2014)
- Harris (2014-2015)
- Microsoft (2013-2014)
- NASA Goddard (2013-present)
- NASA NCCS (2013-present)
- NASA PDCO (2016-present)
- NASG (2013-2018)
- NGCC (2013-2017)
- NOAA (2016-present)
- Northrop Grumman (2014-2016)
- UN (2014-2016)
- Siemens (2016-2018)

Research Projects at Harvard Site (some w/ GMU)

- STC-14-00 Advancing spatiotemporal studies to enable 21st century sciences and applications
- GMU-14-03 Developing a big spatiotemporal data computing platform
- H-14-02 Developing a place name extraction methodology for historic maps
- H-14-03 Development and application of ontologies for NHD and related TNM data layers
- **STC-15-02 Mapping Secondary Cities for Resiliency and Emergency Preparedness**
- **H-17-01 Evaluating OmniSci, Open Source GPU-powered SQL Database**
- **H-19-01 Developing an online spatial data sharing and management platform**
- H-19-06 Elevating Research Excellence with Data Repository and AI Ecosystem
- **STC-20-02 Spatiotemporal Analytics of COVID-19's Second-Order Impacts on Global Vulnerable Urban Areas**
- **H-21-01 Enabling replicable spatiotemporal research with virtual spatial data lab**

Evaluating OmniSci, Open Source GPU-powered SQL Database

- OmniSci is a **massively accelerated analytics and data Science** system. It leverages the full power and parallelism of modern hardware, both CPU and GPU, to explore and extract insight from your largest datasets without lag.
- This project installed OmniSci and PostGIS as **Community Apps on Harvard's HPC Cluster**, and applied it in many big spatial data analytics.
- One application is the computation of **partisan segregation** for 180 million US voters: identify 1000 nearest neighbours and compute distances for **180 billion voter pairs**.

The measurement of partisan sorting for 180 million voters

Jacob R. Brown^{1,2,3,4} and Ryan D. Enos^{1,2,3,4}

Segregation across social groups is an enduring feature of nearly all human societies and is associated with numerous social maladies. In many countries, reports of growing geographic political polarization raise concerns about the stability of democratic governance. Here, using advances in spatial data computation, we measure individual partisan segregation by calculating the local residential segregation of every registered voter in the United States, creating a spatially weighted measure for more than 180 million individuals. With these data, we present evidence of extensive partisan segregation in the country. A large proportion of voters live with virtually no exposure to voters from the other party in their residential environment. Such high levels of partisan isolation can be found across a range of places and densities and are distinct from racial and ethnic segregation. Moreover, Democrats and Republicans living in the same city, or even the same neighbourhood, are segregated by party.

Segregation between human social groups is associated with a range of profoundly negative outcomes, including intergroup conflict, prejudice, inefficient resource allocation, poor democratic governance and other socially deleterious effects^{1,2}. Segregation is also implicated in topics of intense interest across the social sciences, including interpersonal contact and intergroup relations^{3,4}, the bridging nature of social networks^{5,6}, poverty^{7,8} and political representation^{9,10}. Drawing on these associations and using aggregate data, popular and scholarly accounts of politics in the United States—and, increasingly, other Western democracies—describe stark partisan segregation, with members of different political parties living separate lives, resulting in partisan rancour and threatening the functions of the democracy^{11,12}. Yet, despite the association between segregation and important outcomes, and the claims of increasing partisan segregation, the measurement of segregation among partisans, as with the measurement of segregation for most social groups, is severely limited: researchers must usually rely on data aggregations that do not include the actual locations of individuals, and thus measurements are limited to summaries across large geographical areas, and the experience of individual exposure across groups is masked.

rural areas. Such high levels of segregation may imply little exposure to competing political ideas from neighbours. In general, for voters of both parties, high levels of segregation can be found across a range of places and densities, and are distinct from, and sometimes in tension with, racial segregation. Moreover, even when Democrats and Republicans live in the same city—or even the same neighbourhood—they are residentially sorted by political party.

These high levels of partisan isolation have several important implications. In the United States, political party affiliation is considered a social identity, analogous to race or religion¹³, and is a powerful predictor of a range of attitudes and behaviours¹⁴, including behaviours outside of the explicitly political realm^{15,16}. Because partisanship is correlated with political ideology and other attitudes and behaviours, the extent of a voter's partisan isolation is likely to affect their exposure to individuals different from themselves and to competing sociopolitical viewpoints, thus affecting a range of important outcomes. Cross-group exposure can be consequential for the shaping of intergroup attitudes and behaviours¹⁷, including the prejudicial attitudes that are levelled across parties in the United States¹⁸.

Isolated partisan environments may also affect behaviour

A Close-Up Picture of Partisan Segregation, Among 180 Million Voters

By Emily Badger, Kevin Quealy and Ashraf Habibullah (3/17/2021)

Mapping Secondary Cities for Resiliency and Emergency Preparedness

- What are Secondary Cities?
 - Secondary Cities are non-primary cities, characterized by population size, function and/or economic status. They are urban centers of governance, logistics, and production. They are often **data poor** and **under-resourced**.
- Global initiative to address critical geospatial data needs of secondary cities
 - **Emergency preparedness, human security, resilience**
- Data generation and sharing
 - **Open data access**
- Applied Geography - Human geography thematic areas

● Year 1 city ● Year 2 city ◆ Graduated city

* Status as of 2019. In 2021 all cities are graduated.

Spatiotemporal Analytics of COVID-19's Second-Order Impacts on Global Vulnerable Urban Areas

- The Cities' COVID Mitigation Mapping program (C2M2) builds on global networks of geospatial experts to analyze **second-order impacts of COVID-19**.
- The goal of this program is to increase the capacity to understand the **distribution and gaps in resources** available to **vulnerable populations in urban communities** through geospatial analysis.
- This program has three **regional hubs** in Africa, Asia, and Latin America, where select local organizations and universities, with regional geospatial and community development expertise, identify and work with various **local project partners** to develop and guide C2M2 projects in each region.

3 Hubs 10 Countries 12 Cities

Demands for Cyberinfrastructure for Spatial Studies

- Allowing online spatial data sharing in secured environment
- Enabling replicable spatiotemporal research with advanced tools
- Facilitating research collaborations within team members
- Contributing to Spatiotemporal Rapid Response to COVID-19

Challenges for Spatial and Global Studies

❑ Data Sharing

- Licensed data
- Restricted data
- Sensitive data
- Large size data
- Different Resources

❑ Tool Sharing

- Licensed and free tools
- Integrated environment for tools and data
- Management (maintenance and updates)

❑ Research Sharing

- Research (reproducible, replicable, and generalizable)
- Training (students with different interests and skills)
- Applications (efficient, effective, and expandable)

About **84%** re-executions are failed

About Spatial Data Lab

As a part of the NSF Spatiotemporal Innovation Center project, the Spatial Data Lab is co-sponsored by the Center for Geographical Analysis at Harvard University, the China Data Institute, and the Future Data Lab.

Goal: build a cyberinfrastructure for effective and efficient spatial and global studies

Objectives:

- data sharing** for spatial data studies on the cloud
- tool sharing** for quantitative analysis
- research sharing** for workflow-based case studies
- education and training** on data, methodology, technology, and case studies

Main tasks:

- spatial data services
- development of spatial data analysis platform and tools
- development of workflow based case studies for spatiotemporal analysis
- spatial data science training

KNIME Analytics Platform

The screenshot displays the KNIME Analytics Platform interface. The main workspace shows a workflow for data analysis, starting with three Excel Readers (Nodes 26, 27, and 73) that read data from 'CES annual report test'. The workflow includes various data manipulation nodes such as Row Filters, Column Filters, Joiners, and Excel Writers. The workflow is organized into three parallel paths that are later joined together. The interface also shows the KNIME Explorer, Workflow Coach, Node Repository, and Outline panels.

Sponsored Research

□ Research groups

- Data collection
- Mobility study
- Patent study

User Guide and Application for Spatial Data Lab

Application for a User Account on the Platform of Spatial Data Lab

To promote academic collaborations on geo-computation for humanity and social data science, Harvard University, China Data Institute, Future Data Lab, and Wuhan University are working together to build a cloud-based platform (<http://harvard.futuredatalab.org>) for sharing of spatial data, tools, and workflow-based data case studies. This newly established platform is offering limited user accounts to global researchers through an application and evaluation process.

This project encourages applications on the following research data analysis:

- 1) Population Census data (2000 and 2010) aggregated at the province, prefecture, county, and township level, sponsored by China Data Institute (<http://chinadatatcenter.net>)
- 2) Economic Census data (2001, 2004, 2008, 2013, 2018) aggregated at the province, prefecture, county, and ZIP code level, sponsored by China Data Institute
- 3) Microdata from China economic census (2004 and 2008), sponsored by China Data Institute
- 4) Patent data of China (1985-2019), sponsored by IncoPat (<http://incopat.com>)
- 5) Metadata from Wanfang database (journal publications, dissertations, gazetteers, scholars, and experts), sponsored by Wanfang Data (<http://www.wanfangdata.com>)
- 6) COVID-19 research data (infection, death, recovery, mobility, transportation, health facility, climate, news, and policy index), sponsored by the China Data Lab project
- 7) Geolocated social media data (Twitter data), sponsored by the Center for Geographical Analysis at Harvard (<https://gis.harvard.edu/>)

Since we can only support a limited number of users due to cloud resource constraints, the 1st round applications will be restricted to Harvard affiliates only. All applications need to be reviewed and approved. Interested users may fill out this application form and email it to spatialdatalab@lists.fas.harvard.edu. More information about this project can be found at <http://chinadatalab.net>.

Deadline for the 1st round application submission: June 31, 2021.
